

Complete Summary

TITLE

Nursing facility chronic care: percent of residents who have become more depressed or anxious.

SOURCE(S)

PRIMARY MEASURE DOMAIN

Outcome

The validity of measures depends on how they are built. By examining the key building blocks of a measure, you can assess its validity for your purpose. For more information, visit the [Measure Validity](#) page.

SECONDARY MEASURE DOMAIN

Does not apply to this measure

Brief Abstract

DESCRIPTION

This measure is used to assess the percentage of residents who have become more depressed or anxious.

RATIONALE

Depression is a medical problem of the brain that can affect how you think, feel and behave. Signs of depression may include fatigue, a loss of interest in normal activities, poor appetite, and problems with concentration and sleeping.

Anxiety is excessive worry. Signs of anxiety can include trembling, muscle aches, problems sleeping, stomach pain, dizziness and irritability.

Feeling depressed or anxious can lessen your quality of life and lead to other health problems. Nursing home residents are at a high risk for developing

depression and anxiety for many reasons, such as loss of a spouse, family members or friends, chronic pain and illness, difficulty adjusting to the nursing home, and frustration with memory loss. Identifying depression and anxiety can be difficult in elderly patients because the signs may be confused with the normal aging process, a side effect of medication, or the result of a medical condition. Proper treatment may include medication, therapy, or an increase in social support.

This measure is one of fifteen National Nursing Home Quality Improvement (NHQI) measures. These measures provide information to help consumers make informed decisions about their nursing home care. The measures are also intended to motivate nursing homes to improve their care and to inform discussions about quality between consumers and clinicians.

PRIMARY CLINICAL COMPONENT

Chronic care; depression; anxiety

DENOMINATOR DESCRIPTION

All residents with a valid target assessment and a valid prior assessment (see the related "Denominator Inclusions/Exclusions" field in the Complete Summary)

NUMERATOR DESCRIPTION

Number of residents from the denominator whose Mood Scale scores are greater on target assessment relative to prior assessment (see the related "Numerator Inclusions/Exclusions" field in the Complete Summary)

Evidence Supporting the Measure

EVIDENCE SUPPORTING THE CRITERION OF QUALITY

- A formal consensus procedure involving experts in relevant clinical, methodological, and organizational sciences

Evidence Supporting Need for the Measure

NEED FOR THE MEASURE

Use of this measure to improve performance

Application of Measure in its Current Use

CARE SETTING

Long-term Care Facilities

PROFESSIONALS RESPONSIBLE FOR HEALTH CARE

Measure is not provider specific

LOWEST LEVEL OF HEALTH CARE DELIVERY ADDRESSED

Single Health Care Delivery Organizations

TARGET POPULATION AGE

Patients of all ages

TARGET POPULATION GENDER

Either male or female

STRATIFICATION BY VULNERABLE POPULATIONS

Unspecified

Characteristics of the Primary Clinical Component

INCIDENCE/PREVALENCE

About 3 million elderly and disabled Americans received care in our nation's nearly 17,000 Medicare and Medicaid-certified nursing homes in 2001. Slightly more than half of these were long-term nursing home residents, but nearly as many had shorter stays for rehabilitation care after an acute hospitalization. About 75 percent were age 75 or older.

EVIDENCE FOR INCIDENCE/PREVALENCE

Nursing home quality initiative. Overview. Baltimore (MD): U.S. Department of Health and Human Services, Centers for Medicare and Medicaid Services (CMS); 2004 Jan 20. 3 p.

ASSOCIATION WITH VULNERABLE POPULATIONS

Data Collection for the Measure

CASE FINDING

Users of care only

DESCRIPTION OF CASE FINDING

All residents with a valid target assessment and a valid prior assessment

DENOMINATOR SAMPLING FRAME

Patients associated with provider

DENOMINATOR INCLUSIONS/EXCLUSIONS

Inclusions

All residents with a valid target assessment and a valid prior assessment

Exclusions

Residents satisfying any of the following conditions:

1. The Mood Scale score is missing on the target assessment.
2. The Mood Scale score is missing on the prior assessment and the Mood Scale score indicates symptoms present on the target assessment.
3. The Mood Scale score is at a maximum (value 8) on the prior assessment.
4. The resident is comatose or comatose status is unknown on the target assessment.

Refer to the original measure documentation for details.

RELATIONSHIP OF DENOMINATOR TO NUMERATOR

All cases in the denominator are equally eligible to appear in the numerator

DENOMINATOR (INDEX) EVENT

Diagnostic Evaluation
Institutionalization

DENOMINATOR TIME WINDOW

Time window precedes index event

NUMERATOR INCLUSIONS/EXCLUSIONS

Inclusions

Number of residents from the denominator whose Mood Scale* scores are greater on target assessment relative to prior assessment

*Mood Scale score is defined as the count of the number of the following eight conditions that are satisfied (range 0 through 8) on the target assessment:

1. Any verbal expression of distress
2. Shows signs of crying, tearfulness
3. Motor agitation
4. Leaves food uneaten on target or last full assessment
5. Repetitive health complaints
6. Repetitive/recurrent verbalizations
7. Negative statements
8. Mood symptoms not easily altered

Refer to the original measure documentation for details.

Exclusions

Unspecified

MEASURE RESULTS UNDER CONTROL OF HEALTH CARE PROFESSIONALS, ORGANIZATIONS AND/OR POLICYMAKERS

The measure results are somewhat or substantially under the control of the health care professionals, organizations and/or policymakers to whom the measure applies.

NUMERATOR TIME WINDOW

Fixed time period

DATA SOURCE

SCORING

Rate

INTERPRETATION OF SCORE

Better quality is associated with a lower score

ALLOWANCE FOR PATIENT FACTORS

Risk adjustment devised specifically for this measure/condition

DESCRIPTION OF ALLOWANCE FOR PATIENT FACTORS

Risk adjustment refines raw quality measure (QM) scores to better reflect the prevalence of problems that facilities should be able to address.

Risk adjustment for this measure involves exclusion of residents whose outcomes are not under nursing facility control (e.g., outcome is evidenced on admission to the facility) or the outcome may be unavoidable (e.g., the resident is comatose). For each QM, the prevalence of the outcome across all residents in a nursing facility, after exclusions, is the facility-level observed QM score. Refer to the original measure documentation for details.

STANDARD OF COMPARISON

External comparison at a point in time
Internal time comparison

Evaluation of Measure Properties

EXTENT OF MEASURE TESTING

The quality measures have been validated and are based on the best research currently available. These quality measures meet four criteria. They are important to consumers, are accurate (reliable, valid and risk adjusted), can be used to show ways in which facilities are different from one another, and can be influenced by the provision of high quality care by nursing home staff. A formal validation study was conducted involving 5,758 chronic and post-acute residents in 209 nursing facilities in 6 states.

EVIDENCE FOR RELIABILITY/VALIDITY TESTING
